

The Microsoft 365 products represent a set of powerful business tools enabling simple and flexible arrangements for the management and use of their key products and services.

One of the key risks associated to the use of this service is when an account gets compromised – someone unauthorised has 24x7x365 access to everything from contacts and email, through to the most confidential files being stored.

Cipherise for business is a quick and simple product that can be quickly added that stops your M365 accounts from being misused. Working seamlessly across mobiles, desktops and browser access points, it protects your M365 system from being accessed by anyone except your nominated users. Best of all, Cipherise is a non-transferable method – so hackers and scammers cannot steal your employee's access.

## How secure is it?

Cipherise eradicates the dependency on a password and replaces it with a patented and globally unique technology extension called bi-directional entanglement. This ensures that every time you need to access M365, Cipherise ensures M365 is legitimate at the same time it proves to the organisation that you are legitimate. It is powered by complex cryptographic proofs that are unique to each and every user and every organisation, and then we entangle them to ensure nobody can tamper with them without being detected.

## Advantages

Stops account borrowing.

Stops employees inadvertently giving away their account via a phishing scam.

Protects all entry points into M365 including thick clients, web access, and mobile apps.

Stops account take over even if the computer being used is insecure or compromised.

Scales with your business.

Easily add Cipherise to protect other critical services.

Turn on your own single sign on page to provide even easier access and control.

## How does it work?

Cipherise eradicates the ability for someone to provide credentials directly and breaks the traditional chain into two parts. Request access to Horizon using an identity **and then** reach out and contact the owner of the provided identity to ensure they are not just **authorised** but **intending** to access.

We call this attribution, and it is a very powerful concept.

Even if you have a copy of my  
identity, you cannot use it without  
my permission.

## Is it just for Microsoft 365?

Absolutely not!

Cipherise provides multiple integration points across standards such as Security Access Mark-up Language (SAML2.0) as well as custom API's for deep integration. There are thousands of cloud services that Cipherise works with.

## Q & A

---

Q Is it expensive?

A No! Pricing starts as low as \$30AUD (plus tax) per month for a small business with up to 5 users.

---

Q What happens if I accidentally give my email and password away in a phishing scam?

A Nothing if Cipherise is enabled.

---

Q We are currently using Two Factor (2FA) or Multi-Factor authentication (MFA) – should we keep using it?

A Cipherise exceeds 2FA and MFA solutions in security and simplicity so no, stop using them.
